

## Convenient for daily use

In the rice fields near the Buddhist complex of Sre Ampil resides Hom Moun. The 41-year-old farmer lives with his wife (39) and three children of 16 years, 13 years and two months in a wooden house on stilts. He mainly grows rice and has used the MoonLight for two months now.

"I charge the MoonLight every morning and use it every evening. I don't waste money on batteries for a flashlight anymore. The MoonLight is of good quality and it is very convenient. We use it for many different things: it is a lamp at dinnertime, a flashlight when we go to the bathroom, I use it when tending the chickens or when I go to the fields at night."

"Sometimes at night the mice eat rice from the field. To get rid of them, I use an electric wire attached to a car battery, which kills the mice. I must then make sure that I remove the dead mice. If I don't, the wire no longer attracts new mice. Previously I used a flashlight to be able to see, now I can hang the MoonLight around my neck. Other farmers from the neighbourhood also do this and when we wait to catch the mice, we sit together and talk. To be able to see each other, we hang the MoonLight on a tree. When my neighbours saw the MoonLight for the first time, they thought it was an ordinary flashlight. But I explained that it was a lamp on solar power. First they were surprised, now they themselves would like to buy a MoonLight. Because the price is high, they still have to wait until they have enough money."
